

PROTEASE INHIBITORS

FIELD OF INVENTION

5 The present invention relates to novel protease inhibitors.

BACKGROUND OF THE INVENTION

10 One of the most active areas in cancer research is the field of proteolytic enzymes and their role in the spread of cancer. One such class of protease that plays a significant role in the progression of cancer are the serine proteases, in particular Urokinase-type
15 plasminogen activator (uPA). Inhibitors of uPA have been postulated to be of therapeutic value in treating cancer. Inhibitors of these serine proteases also tend to be inhibitors of the closely related blood-clotting enzymes. One such blood-clotting enzyme is Factor Xa.

20 Factor Xa (herein after "FXa"), the converting enzyme of pro-thrombin to thrombin, has emerged as an alternative (to thrombin) target for drug discovery for thromboembolic disorders. A variety of compounds have been developed as potential FXa inhibitors.

25 Kunitada and Nagahara in Current Pharmaceutical Design, 1996, Vol. 2, No.5, report amidinobenzyl compounds as FXa and thrombin inhibitors. Disclosed in U.S. Patent No. 5,576,343 are aromatic amidine derivatives and salts thereof, as reversible inhibitors
30 of FXa. These compounds comprise amidino substituted indolyl, benzofuranyl, benzothienyl, benzimidazolyl, benzoxazolyl, benzothiazolyl, naphthyl, tetrahydronaphthyl and indanyl groups, attached to a substituted phenyl ring by an alkylene group having from 1 to 4 carbon
35 atoms.

 In spite of the above discussed efforts, desirable treatment of cancer and thromboembolic disorders still remains elusive. There is thus a need for new compounds that will be effective in inhibiting serine proteases,

The novel compounds of Formula I can be prepared using the reactions and synthetic techniques described below. It should be noted that compounds of Formula I include compounds of Formula Ia. These compounds of Formula Ia represent some of the novel compounds of the present invention and can be further transformed to provide other novel compounds of the present invention.

The reactions are performed in a solvent appropriate to the reagents and materials employed and suitable for the transformations being effected. It will be understood by those skilled in the art of organic synthesis that the functionality present on the molecule should be consistent with the transformations proposed. This will sometimes require a judgment to modify the order of the synthetic steps or to select one particular process scheme over another in order to obtain a desired compound of the invention.

It will also be recognized that another major consideration in the planning of any synthetic route in this field is the judicious choice of the protecting group used for the protection of the reactive functional groups present in the compounds described in this invention. An authoritative account describing the many alternatives to the trained practitioner is Greene and Wuts (Protective Groups in Organic Synthesis, Wiley and Sons, 1991).

Proton NMR's (^1H NMR) were obtained using deuterated solvents such as dimethyl sulfoxide (DMSO-d_6), deuterated chloroform (CDCl_3), or other appropriate solvents. Schemes I to XXXV illustrate synthesis of precursors useful in the synthesis of compounds of Formula I, or synthesis of compounds of Formula I, having a benzimidazole nucleus, i.e., wherein "A" represents benzimidazole, and Tables 2a and 2b list them. These compounds of Formula I can be represented by the following structural formula:

wherein R^1 , R^2 , R^3 , R^4 , R^5 , R^6 , R^7 , R^8 and R^{20} are as defined in the detailed description of the invention.

5 The aldehydes, represented by structures 3, 5, 8, 10, and 13 and the carboxylic acids represented by structures 44, 48, and 53 and 55 are useful intermediates in the synthesis of the novel compounds of Formulae I and Formula Ia. The aldehydes and carboxylic acids useful in
10 the synthesis of compounds of Formula I either are commercially available or can be prepared by the synthetic schemes outlined below.

 Schemes I-IX illustrate the synthesis of aldehydes which can be used to synthesize compounds of Formula I.

15 Scheme I:

20 in which R^{1a} is H or R^1 , and R^2 , R^3 , and R^5 are as defined in the detailed description.

Scheme I is a representative example of the synthesis of aldehyde 3 using the Mitsunobu reaction. The general procedure comprises mixing an appropriately substituted benzaldehyde, 1, with a Boc protected piperidinol in the presence of triphenyl phosphine in an inert solvent, such as THF, at temperatures ranging from -25° to ambient temperature, preferably 0°. To the cooled mixture is added diethyl azido dicarboxylate (DEAD) in a drop wise manner (about 0.5 to 1 mL per minute). The resulting reaction mixture is stirred at room temperature for 2 to 24 hours after which time the reaction mixture is concentrated under reduced pressure to yield a residue of the desired aldehyde, 3. Purification of the desired aldehyde can be accomplished by using methods such as chromatography, recrystallization or other methods known to one skilled in the art.

Scheme II:

in which R^{1a} is hydrogen or the same as R¹.

Scheme II outlines the synthesis of aldehyde 5. The procedure involved forming a reaction mixture by combining an appropriate benzaldehyde 1, such as 4-hydroxy benzaldehyde, ethyl bromoacetate, 4, potassium carbonate and sodium iodide, in an inert solvent, preferably acetone. The reaction mixture is stirred at ambient temperature for 12 to 24 hours after which time

the reaction mixture is filtered through celite, and concentrated under reduced pressure to yield an oily residue. This residue can be purified by column chromatography to yield the desired aldehyde, 5.

5

Scheme III:

10

Scheme III represents a general procedure for preparing aldehydes of formula 8. The procedure comprises mixing 4-hydroxy benzaldehyde 6, substituted thiazole 7, sodium carbonate, cesium carbonate, and sodium iodide in an inert solvent, such as acetone, to form a reaction mixture which is refluxed for eighteen hours. The reaction mixture is cooled to room temperature, filtered through celite, and the filtrate evaporated to yield a residue. The residue is dissolved in ethyl acetate and washed, in succession, with 2% aqueous sodium hydroxide, water, and brine solution. This washed organic layer is concentrated to yield the desired aldehyde 8.

25

Scheme IV:

Scheme IV depicts a method of preparing aldehyde, **10**. This method comprises reacting a N,N-dimethylformamide (DMF) solution of a hydroxy benzaldehyde, **11**, with sodium hydride at about 0° followed by drop wise addition (about 1 mL per minute) of a DMF solution of dicyanonitrobenzene **9**. The resulting mixture is stirred from 12 to 24 hours followed by cautious pouring of the reaction mixture in ice water to yield a product. The product is collected by filtration, dried, and purified by recrystallization, e.g., from ethyl acetate, to yield aldehyde **10**.

Scheme V

Scheme V depicts a method of preparing aldehyde 13. For example, an aldehyde of formula 11 wherein R³, R⁴, and R⁵ are hydrogen, i.e., 2,3-dihydroxybenzaldehyde (0.6g, 4.3 mmol) was added to dimethyl sulfonamide (DMSO) (10 ml) containing sodium hydride (0.25g, 10.4 mmol). After one hour a solution of benzyl bromide (0.52 ml, 4.3 mmol) in DMSO (5 ml) is added. Stirring the mixture is continued for 24 h, after which time the mixture is poured into water and extracted with chloroform (2x). The aqueous solution then was acidified with 6N hydrochloric acid to adjust the pH from 2 to about 4 and extracted with chloroform (3x). The latter organic layers were washed with 1N hydrochloric acid and filtered over silica gel to give 3-benzyloxy-2-hydroxy benzaldehyde.

¹H NMR (300 MHz, CDCl₃) δ: 11.13 (s, 1H), 9.92 (s, 1H), 7.50-6.85 (m, 8H), 5.20 (s, 2H).

Scheme VI

Scheme VI depicts a method for preparing aldehyde 15. For example, a mixture of an aldehyde of formula 14 wherein R³ and R⁵ are hydrogen, i.e., 5-chloro,2-hydroxy benzaldehyde (0.10 g, 0.64 mmol) and N-iodosuccinimide (0.16 g, 0.71 mmol) in acetic acid (2 mL) was heated to 95° C for 2 h. Another portion of N-iodosuccinimide (0.020 g, 0.09 mmol) was added and heating was continued for 1 h. The mixture was diluted with ethyl acetate,

washed in succession with 5 % aqueous $\text{Na}_2\text{S}_2\text{O}_3$, saturated NaCl , and dried (Na_2SO_4). The solvent was removed under reduced pressure, and 5-chloro-3-iodo-benzaldehyde was obtained as a yellow crystalline solid (0.17 g, 94%)

Scheme VII

10 Scheme VII illustrates the synthesis of benzyl protected aldehydes **17**.

For example, sodium hydride (0.52g, 21.7 mmol) is added to DMSO (20 ml) followed by an aldehyde of formula **11** wherein R^3 , R^4 and R^5 are hydrogen, i.e., 2,3-dihydroxybenzaldehyde, (2.8g, 20.2 mmol). After stirring the solution for 1 h at ambient temperature, benzyl bromide **12** (2.4 ml, 20.2 mmol) was added forming a red-brown reaction mixture which was further stirred 12 h at ambient temperature. The solution was then partitioned between ethyl acetate (200 ml) and 0.5 N hydrochloric acid (300 ml). The organic layer was separated and

MgSO₄, filtered and concentrated to afford a brown oil. The brown oil is purified by flash chromatography (15% ethyl acetate / hexane) to give 3.21 g of 2-benzyloxy-3-hydroxy-benzaldehyde **16**.

2-benzyloxy-3-hydroxy-benzaldehyde **16** (0.30g, 1.3 mmol), triphenylphosphine (0.41g, 1.6 mmol) and 2-(2-hydroxyethyl)pyridine (0.18 ml, 1.6 mmol) were stirred in THF (15 ml), followed by the addition of DEAD (0.25 ml, 1.6 mmol). After stirring for 12 h, the reaction mixture is partitioned between ethyl acetate (200 ml) and saturated aqueous sodium hydrogen carbonate (200 ml). The organic layer is separated, dried (MgSO₄), filtered and concentrated to give a brown oil. The brown oil is purified by flash chromatography (50% ethyl acetate/hexanes) to afford 0.29 g (66%) of 2-hydroxy-3-(2-pyridin-2-ylethoxy)benzaldehyde **17** as a light yellow solid.

The bromo-benzaldehyde **18** is typically combined with the methyl acrylate (1.5 eq.), triphenyl phosphine (0.33 eq.), palladium acetate (0.15 eq.) and triethylamine (2 eq.) in benzene and the mixture refluxed for 12-18 h. After cooling the mixture is

diluted with 0.05N HCl and extracted with ethyl acetate. The organic extracts are washed with water, then brine and dried (MgSO₄). Filtration followed by purification over silica gel affords the desired aldehyde **19**.

Scheme XIII :

5

Scheme XIII illustrates the synthesis of a diacid used to make compounds of carboxylic acid 55.

For example to a 500 mL round bottom flask charged with 170mL of water and compound of formula 54, wherein
 10 R^3 , R^4 and R^5 are hydrogen, i.e., 2-methoxy-1,3-dimethylbenzene, (5 g, 36.7 mmol) was added KMnO_4 (12.2 g, 77.2 mmol). The solution was heated to a gentle reflux using an oil bath until the purple color had disappeared (2 hour). Another batch of KMnO_4 (12.2 g, 77.2 mmol) was
 15 added and the heating was continued until the purple color was destroyed (2-2.5 hour). The reaction mixture was cooled slightly and the precipitated oxides of manganese were filtered through Celite. After washing the precipitates with warm water (2 x 50 mL), the
 20 filtrate was concentrated under reduced pressure to about 1/3 its original volume. This concentrated filtrate was acidified to pH 2.5 and the resulting fine white precipitate was filtered and dried overnight under reduced pressure on a high vacuum pump, yielding 2-methoxy isophthalic acid 55 as a white powder (6.8 g, 94%
 25 yield).

$^1\text{H-NMR}$ (300 MHz, DMSO-d_6) δ : 7.97 (d, 2H), 6.9 (t, 1H), 2.5 (s, 3H).

The following schemes (XX to XXI) generally can be
 30 used to prepare compounds of Formula I having a benzimidazole nucleus.

Scheme XX

Formula Ia

5 Scheme XX outlines general procedures (Method A) for the synthesis of compounds of Formula Ia. Scheme XX requires refluxing a mixture of diaminobenzimidine monohydrochloride with an aldehyde in the presence of an oxidizing agent (e.g., benzoquinone, sodium metabisulfite, and the like) in ethanol for about 12 hours. The mixture is then cooled to room temperature and poured into acetonitrile. This results in the generation of the desired product of Formula Ia which is further washed with fresh acetonitrile and dried.

Scheme XXI

5

Formula I

The above Scheme XXI (Method B) can also be used to make compounds of Formula Ia. An appropriate carboxylic acid, is heated at 180°C with the hydrochloride salt of diamino benzene derivative in poly phosphoric acid (PPA) under a nitrogen atmosphere (until the carboxylic acid had reacted completely). This reaction mixture is cooled to room temperature and diluted with water (or dilute HCl) to yield a suspension. The suspension is isolated, and washed with cold water and dried to yield a compound of Formula Ia in the above scheme.

If Scheme XX or XXI utilizes appropriately protected acids or aldehydes, the final products depicted in Table 2 were realized by standard deprotection techniques known to one skilled in the art of organic synthesis (See Greene, 'Protecting groups in Organic Synthesis'). Thus, for example, BOC groups were removed using HCl or TFA. In the case of an aldehyde, which has a benzyl protecting

group at R², after the Method A reaction of this aldehyde with 3,4-diaminobenzamidine, the crude dark purple solid is isolated and then subjected to hydrogenation conditions in ethanol with Pd (10% on activated carbon).

- 5 After 2 h, the Pd is filtered and the filtrate is concentrated to ~20 ml and added to ether with vigorous stirring. After filtering and drying the product is isolated, represented by Example 172 in Table 2.

A variation of the above scheme XXI is used to make
10 Examples 100 and 200 shown below:

Example 100, Table

2.

- 15 The procedure is the same as Scheme XXI, except that 4-guanidino,1,2-diaminobenzene is used instead of 3,4-diaminobenzamidine.

Example 200 uses the acid from Scheme XIII which is reacted with 3,4,-diaminopyridine in the presence of
20 polyphosphoric acid (Method B, Scheme XXI). The resultant compound is then reduced and appropriately substituted to yield Example 200.

Table 2 lists examples of compounds of Formula I
 (and Ia) prepared by the above synthetic schemes XX and
 5 XXI, methods A and B respectively.

Compounds of Formula I wherein R⁷ is an amidino group
 (C(=NH)NH₂) can also be prepared by treating compounds of
 Formula I wherein R⁷ = CN with NH₂OH followed by Zn in
 acetic acid.

The following discussion illustrates transformation of compounds of Formula Ia, Table 2, into compounds of Formula I. Compounds of Formula I prepared by these schemes are included in Table 2a.

35 Compounds of Formula I in which any of R², R³, R⁴ and R⁵ are amino can be prepared by reducing a corresponding compound of Formula Ia in which R², R³, R⁴ or R⁵ nitro. The reduction can be accomplished in any number of ways known to one skilled in the art. For example, a representative way of reducing the nitro group is by

catalytic hydrogenation. The catalytic hydrogenation is carried out by mixing an appropriate nitro compound of Formula I with Pearlman's catalyst in a suitable solvent (e.g., methanol). Air from the reaction vessel is removed
5 under reduced pressure and the reaction vessel is then charged with an atmosphere of hydrogen. The resulting mixture is stirred for about 18 hours, is filtered to remove the catalyst, and is concentrated to yield the desired amine.

10 Compounds of Formula I in which any of R^2 , R^3 , R^4 and R^5 are $-NR^{10}R^{24}$ wherein R^{24} is other than hydrogen, can be prepared by reductive amination of a suitable aldehyde with a corresponding compound of Formula I in which R^2 , R^3 , R^4 or R^5 is amino. The reductive amination is carried
15 out by stirring a mixture of the amine with the aldehyde and molecular sieves, in methanol under an atmosphere of nitrogen for about 2 hours. Sodium cyanoborohydride is then added to the reaction mixture and the resulting mixture is stirred at ambient temperature for about 15
20 hours. The reaction mixture is then filtered through celite and the filtrate is concentrated. The residue may be purified by chromatography.

Compounds of Formula I in which any of R^2 , R^3 , R^4 and R^5 comprise groups containing an annular nitrogen atom may
25 be further derivatized to an corresponding N-1-iminoethyl substituted derivative by reacting the compound with ethyl acetamidate. For example, a compound of Formula I in which R^4 is 4-(1-(1-iminoethyl)piperindin-4-yloxy)benzylamino can be prepared by reacting a
30 corresponding compound of Formula I in which R^4 is 4-piperidin-4-yloxybenzyl amino with ethyl acetamidine hydrochloride and triethyl amine in ethanol and stirring over night under a nitrogen atmosphere. The reaction mixture is concentrated under reduced pressure and
35 residue may be purified by column chromatography.

Compounds of Formula I in which any of R^2 , R^3 , R^4 and R^5 are or contain a carboxy group can be prepared by hydrolyzing a corresponding compound of Formula Ia in

which R², R³, R⁴ or R⁵ is or contains a -COOR¹⁰ group. For example, a compound of Formula I in which R³ is carboxymethoxy can be prepared by hydrolyzing a compound of Formula I in which R³ is ethoxy carbonyl methoxy.

5 Compounds of Formula Ia in which any of R², R³, R⁴ and R⁵ are or contain a carboxy group can be derivatized to a compound of Formula I in which R², R³, R⁴ or R⁵ is or contains -CONR¹¹R¹² or -C(O)NR³³R³⁴ by reacting the acid with an appropriate amine. For example a compound of Formula
10 I in which R³ is carboxy methoxy is converted to a compound in which R³ is 2-(1,3-dihydro isobenzofuran-5-yl)ethylcarbonyl methoxy by reacting the acid with 2-(1,3-dihydro isobenzofuran-5-yl)ethyl amine in the presence of a suitable coupling agent (e.g., N,N'-
15 carbonyl diimidazole (CDI), PyBOP, and the like)

Compounds of Formula I in which any of R², R³, R⁴ and R⁵ are halo can be prepared by halogenating a corresponding compound of Formula I in which R², R³, R⁴ and R⁵ is hydrogen. For example, a compound of Formula I
20 in which R² and R⁴ are bromo was prepared by reacting 4-(6-carbamimidoyl-1H-benzoimidzol-2-yl)-3-hydroxy phenoxy acetic acid (Example 203, Table 2a) (100 mg, 0.307 mmol) with N-Bromosuccinimide (55mg, 0.307 mmol) in anhydrous DMF (5 mL). The reaction mixture is allowed to stir at
25 room temperature for 1 hr forming a deep red-orange solution, which is added dropwise to a stirring solution of anhydrous ether and the resultant red precipitate is isolated and dried under vacuum to afford 115 mg (77.4 %) of a red solid. The crude material is dissolved in a
30 50:50 mixture of 1N HCl/MeOH (10 mL) and purified using reverse-phase C-18 HPLC (2-50% gradient) to yield 10 mg of 2,6-dibromo-4-(6-carbamimidoyl-1H-benzoimidzol-2-yl)-3-hydroxy phenoxy acetic acid (Example 204, Table 2a) as a yellow solid.

35 Compounds of Formula I in which Q, Q¹, Q² and/or Q³ or L¹, L², L³ and/or L⁴ are N-R³⁷ can be prepared by reacting a corresponding compound of Formula I in which Q, Q¹, Q² and/or Q³ or L¹, L², L³ and/or L⁴ is NH with a suitable

protected amino acid. The reaction is typically carried out in the presence of a coupling agent (e.g., PyBOP, CDI, and the like). For example a compound of Formula I in which R² is 1-aminoacetyl pyrrolidin-3yloxy was prepared by coupling a PyBrOP peptide onto Example 139, Table 2 to give the product Example 208, Table 2a.

tert-Butoxycarbonyl amino acetic acid and 2-(2-hydroxy-3-pyrrolidin-3-yloxyphenyl)-1H-benzoimidazole-5-carboxamide Example 139 (Table 2), were suspended in DMF (1.0 mL) under a N₂ atmosphere. Diisopropylethylamine was added and the mixture was cooled in a water/ice bath at 0°C. PyBrOP was quickly added to the cold suspension. The mixture was allowed to warm to ambient temperature to form a solution. The reaction was allowed 2 h and then the reaction mixture was added to EtOAc forming a precipitate. The precipitate was isolated and dissolved in 3M aqueous HCl using a vortex mixer. This solution was kept at rppm temperature for 25 minutes and then diluted with H₂O and CH₃CN. The mixture was filtered. Preparatory HPLC (linear gradient, 2-35% CH₃CN in 0.01 M aqueous HCl) followed by lyophilization gave 28 mg a of Example 208, Table 2a. Analytical HPLC, (λ = 214 nm), 99%.

Compounds of Formula I in which any of R², R³, R⁴ and R⁵ are or contain a NHSO₂R (R = alkyl, aryl, and the like) group can be prepared by sulfonating a corresponding compound of Formula I in which R², R³, R⁴ or R⁵ are or contain an amino group. For example, a compound of Formula I wherein R² is methyl sulfonyl amino is prepared as follows.

A mixture of 2-(3'-Amino-5-chloro-2-hydroxy-biphenyl-3-yl)-1H-benzoimidazole-5-carboxamidine **73** (0.070 g, 0.15 mmol) and THF/water (1:1, 0.5 mL) is chilled (0° C) and treated with 2 N NaOH (0.16 mL, 0.32 mmol) and methane sulfonyl chloride (0.013 mL, 0.16 mmol) in alternating portions. The mixture is kept at 0° C for 1 h and then treated with another portion of 2 N NaOH (0.016 mL, 0.032 mmol) and methane sulfonyl chloride

(0.001 mL, 0.013 mmol). After another 1 h, the solvents were reduced in volume under reduced pressure, and the crude material is purified by C18 reversed-phase HPLC (2-65 % MeCN/H₂O containing 20 mM HCl, over 50 min.). The appropriate fractions were pooled and the solvent is removed under reduced pressure. 2-(5-chloro-2-hydroxy-3'-methanesulfonylamino-biphenyl-3-yl)-1H-benzoimidazole-5-carboxamide **74** is obtained as a tan powder (0.012 g, 16 % yield) (Example 288, Table 2a):

Compounds of Formula I in which A is 4-(5-carbamimidoyl-4,5,6,7-tetrahydro-1H-imidazo[4,5-c]pyridin-2-yl) can be prepared by hydrogenating a corresponding 1H-imidazo[4,5-c]pyridinyl derivative to give a 4,5,6,7-tetrahydro-1H-imidazo[4,5-c]pyridinyl intermediate and then reacting the intermediate with 1H-pyrazole-1-carboxamide. The hydrogenation is carried out under standard conditions. For example, the hydrogenation can be effected with a suitable catalyst (e.g., PtO₂, etc.) in a suitable solvent (e.g., methanol).

The reaction with the amidine typically is carried out in the presence of base (e.g., Hunig's base, etc.) in a suitable solvent (e.g., anhydrous DMF) at 20° to 100°C and requires 12 to 24 h to complete. Compounds of Formula I can be prepared by proceeding as in Scheme XXI but substituting an appropriate diamino pyrrolidine derivative for the diamino benzene derivative.

PtO₂ (20 mg) and concentrated hydrochloric acid (5 mL) was added to a solution of 2-[2-Hydroxy-3-(1H-imidazo[4,5-c]pyridin-2-yl)-phenyl]-1H-benzoimidazole-5-carboxamide (Example 120, Table 2) (100 mg, 0.27 mmol) in MeOH (20 mL). The mixture was hydrogenated at 50 psi in a Parr apparatus for 12-18 h. After the hydrogenation was completed, the catalyst was filtered and the filtrate was concentrated to dryness. HPLC purification (2-50% acetonitrile / 60 minutes) followed by lyophilization afforded 2-[2-Hydroxy-3-(4,5,6,7-tetrahydro-3H-imidazo[4,5-c]pyridin-2-yl)-phenyl]-1H-benzoimidazole-5-

carboxamidine **75** as pale yellow powder (20 mg, 20% yield) (Example 296, Table 2a).

Hunig's base (0.042 mL, 0.24 mmol) was added to a suspension of 2-[2-Hydroxy-3-(4,5,6,7-tetrahydro-3H-imidazo[4,5-c]pyridin-2-yl)-phenyl]-1H-benzoimidazole-5-carboxamidine **75** (19mg, 0.04 mmol) and 1H-pyrazole-1-carboxamidine hydrochloride (12 mg, 0.082 mmol) in anhydrous DMF and the mixture was stirred for 12-18 h at 80 °C. The mixture was poured into water (15 mL) / diethyl ether (15 mL). The aqueous layer was washed with diethyl ether (3 x 10 mL) and concentrated to dryness. HPLC purification (2-50% acetonitrile / 60 minutes) afforded 2-[3-(5-Carbamimidoyl-1H-benzoimidazol-2-yl)-2-hydroxy-phenyl]-3,4,6,7-tetrahydro-imidazo[4,5-c]pyridine-5-carboxamidine **76** as a lyophilized yellow light powder (15.5 mg, 75% yield) (Example 298, Table 2a).

yellow solid (18 mg, 15 % yield).

Example 285 Table 2a

30 To a cold (0°C) solution of 2-(5-amino-2-hydroxy-
phenyl)-3H-benzimidazole-5-carboxamide dihydro- chloride
(0.203 g, 0.6 mmol) in dry pyridine under nitrogen is
added methane sulfonyl chloride (93 uL, 1.2 mmol)
dropwise. After stirring the solution for 12-18 h
35 followed by warming it to ambient temperature the solvent
is removed and the residue is purified by reverse phase

HPLC. Appropriate fractions were lyophilized to an off white solid. (125 mg, 60% yield).

SYNTHESIS OF INDOLE BASED COMPOUNDS OF FORMULA I

- 5 Procedures LI through LXI discuss the synthesis of precursors useful in synthesizing indole based compounds of Formula I. These indole based compounds of Formula I can be structurally represented as follows.

10 wherein R^1 , R^2 , R^3 , R^4 , R^5 , R^6 , R^7 , R^8 , R^9 and R^{20} are as described in the detailed description.

15 Compounds of Formula I having the indole nucleus can be synthesized by using commercially available ketones or carboxylic acids, for example compounds 210 to 237, and aldehyde compounds 240(a) to 240(e) which can be prepared by schemes LI through LXI. discussed below.

Scheme LI

Scheme LI illustrates the general procedure for condensation of acetophenones and substituted aromatic

aldehydes, wherein R¹, R², R³, R⁴ and R⁵ are as described in the detailed description section above.

Compounds of Formula **201** wherein R²⁰ is CH₂R can be prepared by methods illustrated by Scheme LI. For example compound **204** wherein R¹ is hydrogen, R² and R⁴ are fluoro and R³ is hydrogen, i.e., 1-(3,5-difluoro-2-hydroxyphenyl)ethanone **204** (6.3 mmol) and benzaldehyde (7.56 mmol) are mixed in ethanol (20 mL) and aqueous barium hydroxide (2 gm in 15 mL water) (aqueous NaOH (10 %) may be substituted for barium hydroxide) is added. The mixture is stirred for 12-18 h at 60° (reaction times can vary between 3 h to 18 h). The mixture was filtered and the solids which were collected were washed with water (30 mL) and ether (20 mL). The solids are taken up in 1N HCl (30 mL) and the solution extracted with ethyl acetate. The organic extracts are washed with water, brine and dried (MgSO₄) to afford 1-(3,5-difluoro-2-hydroxyphenyl)-3-propenone the title compound **205** as a yellow-brown solid in a 70% yield.

1-(3,5-difluoro-2-hydroxyphenyl)-3-propenone **205** was catalytically hydrogenated using PtO₂-C (10%) as a catalyst (can substitute Pd-C or Pd(OH)₂ as catalysts) and ethyl acetate as a solvent for 15 min (or until reduction is completed). The catalyst was filtered off and the filtrate was evaporated to yield 1-(3,5-difluoro-2-hydroxyphenyl)-3-propan-1-one **206** (Example 505, Table IIIa).

Scheme LII

Scheme LII illustrates synthesis of ketones **210**, wherein R^1 , R^2 , R^3 , and R^5 are as defined in the detailed description section above.

For example 1-(5-bromo-2-hydroxy phenyl)ethanone **206** (6.6 g, 30.7 mmol), methyl acrylate (4.17 mL, 46 mmol), triphenyl phosphine (2.43 g, 9 mmol), palladium acetate (1.03 g, 4.6 mmol), and triethyl amine (6.07 g, 60 mmol) were combined with benzene (100 mL) and refluxed over 18 h. The reaction mixture is cooled to room temperature, diluted with 0.05 N HCl (100 mL) and extracted with ethyl acetate. The organic layer is separated and further washed with water and then brine solution. The organic layer is dried (MgSO_4), and concentrated to yield an oily residue. Purification of this residue by column chromatography (10:1.5, hexanes: ethyl acetate) afforded 5-(2-carboxy vinyl-2-hydroxy)benzoic acid **207** as a yellow solid.

¹H NMR (CDCl₃, 300 MHz) •: 12.22 (s, 1H), 8.23 (s, 1H), 7.94 (d, 1H, J = 8.7 Hz), 7.67 (d, 1H, J = 16 Hz), 7.0 (d, 1H, J = 8.7 Hz), 6.8 (d, 1H, J = 16 Hz).

5- (2-carboxy vinyl-2-hydroxy)benzoic acid 207 was converted to 3-[4-ydroxy-3-(3-phenyl-acryloyl)-phenyl]-acrylic acid as described by general condensation procedure in Scheme LI above, to yield 208.

¹H NMR (DMSO-d₆) δ: 12.81 (s, 1H), 8.54 (s, 1H), 8.12 (d, 1H, J = 5.5 Hz), 7.91 (m, 4H), 7.67 (d, 1H, J = 16.0 Hz), 7.49 (m, 3H), 7.04 (d, 1H, J = 8.7 Hz), 6.57 (d, 1H, J = 6.0 Hz).

3-[4-Hydroxy-3-(3-phenyl-acryloyl)-phenyl]-acrylic acid was converted to 3-[4-hydroxy-3-(3-phenyl-propionyl)-phenyl]-propionic acid 209 as described by general reduction procedure in Scheme LI.

General procedure for brominating at position R²

The carboxylic acid 209, for example 3-[4-Hydroxy-3-(3-phenyl-propionyl)-phenyl]-propionic acid, (1.04 gm, 3.4 g mmol) was dissolved in DMF (7 mL) and N-bromosuccinimide (0.65 g, 3.66 mmol) was added to the solution. The mixture was stirred at ambient temperature for 2.5 h, diluted with ether and the organic layer was separated and washed with water and brine and then filtered through a pad of magnesium sulfate and concentrated. The residue was purified by flash chromatography (3.5:1.5:0.1 of hexane:ethyl acetate:acetic acid) to give 0.5 g of 3-[3-bromo-4-hydroxy-5-(3-phenyl-propionyl)-phenyl]-propionic acid 210 as a yellow-brown oil.

¹H NMR (CDCl₃) δ: 7.61 9 (d, 1H, J= 1.9 Hz), 7.54 (d, 1H, J= 1.9 Hz), 7.27 (m, 5H), 3.33 (t, 2H, J= 7.3 Hz), 3.06 (t, 2H, J= 7.8 Hz), 2.86 (t, 2H, J= 2,23 Hz), 2.64 (br.t, 2H).

Scheme LIV illustrates synthesis of 220 which is useful in synthesizing compounds of Formula I.

219: 2-hydroxy-3-phenylbenzoic acid (218, 3.0 g, 14 mmol) is dissolved in EtOAc (50 ml) and a few drops of DMF are added. Oxalyl chloride (2.5 ml, 1.5 eq) is added and the reaction is stirred under a dry atmosphere for 1 h. The reaction mixture is then concentrated in vacuo to yield a mixture of clear oil and white solid. This mixture is diluted with CH₂Cl₂ (50 ml) followed by the addition of N,O-dimethyl hydroxylamine hydrochloride (1.5 g, 1.1 eq) and triethylamine (3.9 ml, 2 eq). This mixture is stirred for 12-18 h under a dry atmosphere. Dilution of the reaction mixture with EtOAc and subsequent washing with dilute HCl and brine, followed by drying (MgSO₄) and concentration in vacuo yields a mixture of reaction products. Flash chromatography (20/80 EtOAc/Hexanes) afforded N-methoxy-N-methyl-2-hydroxy-3-phenylbenzamide (219, 1.09g) as a white solid.

¹H NMR (CDCl₃) δ: 11.42 (s, 1H) 7.94 (dd, 1 H, J = 1.7, 8.1 Hz) 7.61-7.58 (m, 1H) 7.48-7.36 (m, 6 H) 6.93 (t, 1 H, J = 2.3, 3.4 Hz) 3.70 (s, 3 H) 3.45 (s, 3 H).

220

N-methoxy-N-methyl-2-hydroxy-3-phenylbenzamide (219, 2.37 g, 9.2 mmol) is dissolved in dry THF (40 ml) under

nitrogen and cooled to 0°C in an ice bath. MeMgBr (6.5 ml, 2.1 eq) is added and the resulting heterogeneous reaction is stirred for 1 h, THF (50 ml) is added to facilitate stirring, followed by excess MeMgBr. The reaction is then stirred for 3 days followed by quenching with dilute HCl. This mixture is then partitioned between ether and water. The organic phase is washed with brine, dried (MgSO₄) and concentrated in vacuo to yield a mixture of starting material (219) and product (220). Flash chromatography (EtOAc/Hexanes) affords 2-hydroxy-3-phenylacetophenone (220, 0.78 g) as a white solid.

Scheme LVIII

Scheme LVIII is a method that involves using a Suzuki coupling to generate substituted acetophenones (Example 519, Table IIIa).

The compound 2'-Hydroxy-3'-bromo-5'-methylacetophenone **233** (Example 509, Table IIIa) is synthesized from the acetophenone using the bromination procedure in Scheme LII.

2'-Hydroxy-3'-bromo-5'-methylacetophenone **233** (0.46 g, 2 mmol) and phenylboronic acid (0.24 g, 1 eq.) are dissolved in DME (10 ml) and placed under a nitrogen atmosphere. Na₂CO₃ (0.50 g, 3 eq.) in water (10 ml) is added, followed by Pd(Ph₃)₄ (0.12 g, 0.05 eq.) and the reaction mixture heated to 75°C for 12-18 h. Most of the DME is removed in vacuo and the reaction mixture is diluted with ether, washed with water, brine, and dried (MgSO₄), and concentrated in vacuo to give an oil. Purification by flash chromatography (5/95 EtOAc/hexanes) afforded 2'-Hydroxy-3'-phenyl-5'-methylacetophenone **234** as a yellow solid (0.32 g, 71% yield) (Example 519, Table IIIa).

Alternatively 2'-Hydroxy-3'-bromo-5'-methylacetophenone **233** can be treated as follows: LDA (20 mL, 1.5 M) is slowly added to a THF solution of **233** at about 0° and the reaction mixture is then cooled to about -78° followed by the addition of bromo acetonitrile (40 mmol). This resulting reaction mixture is stirred for 12-18 h at -78° and is then quenched with 1N HCl followed by extraction with ether. The ether layer is washed with water, dried (MgSO₄) and concentrated to yield an oil. This oil is purified by flash chromatography (4:1; hexanes:ethyl acetate) to yield 1 g of **235**. discussed below:

3-Bromo-2-hydroxy-5-methylbenzaldehyde.

A mixture of 2-bromo-4-methylphenol (5.0 g, 27 mmol),
chloroform (50 ml), water (10 ml) and NaOH (10 g) was
refluxed for 3 hrs. The reaction mixture was cooled to
ambient temperature, and then was acidified to pH = 2 with

The yellow oil then was treated with Benzyl bromide
analogous to the procedure in Scheme VII above to yield the
corresponding benzyl protected aldehyde.

Scheme LX(1) above.

Scheme LX(2)

 30 magnesium dichloride (1.5 eq, 43 gm.). The preceding

mixture then was mixed with paraformaldehyde (6.0 eq, 54 gr) in portions over 10 min. to avoid vigorous exotherm forming a yellow mixtue. The yellow mixture then was refluxed gently for 1.5 hours. A Thin Layer Chromatography (TLC) indicated a clean conversion to the more hydrophobic desired product (R_f =0.44, 20% EtOAc/Hexane) and complete consumption of the starting phenol.  reaction mixture then was cooled to ambient temperature,
 diluted with ethyl acetate and washed with saturated sodium
 hydrogen carbonate (2x) followed by brine (1x). The
 combined organic layers were dried over sodium sulfate,
 15 filtered and concentrated to yield a crude oily mixture.
 The crude was purified by passing through silica gel
 eluting with 30% ethyl acetate in hexanes to give the
 product (120 mg) 24%.

Compounds analogous to **240(e)** with different
 20 substituents can be prepared by following the procedure in
 Scheme LX(5) above.

 extra methylene group than R²⁰, thus one can represent R^{20a}
 as CH₂-R²⁰.

Synthesis of aryl hydrazines which are useful in the preparation of indole based compounds of Formula I in the Fischer-Indole synthesis discussed below.

Most of the aryl hydrazines are prepared using the procedure of Castro et al., J. med. Chem., 1994, Vol. 37, No. 19, p 3030 from commercially available materials. In the case of the chloro substituted hydrazine used in the synthesis of Example 839, Table III the following scheme is used.

Scheme LXI

wherein R^8 is Cl; R^6 and R^7 are as defined in the detailed description.

To a *p*-xylenes solution of the nitrile **255** (0.5 g, 3.3 mmol) is added a freshly prepared solution of $\text{Me}_3\text{Al}/\text{NH}_4\text{Cl}$ (16 ml, 3 eq.). ($\text{Me}_3\text{Al}/\text{NH}_4\text{Cl}$ solution can be prepared by adding 5g of ammonium chloride to *p*-xylenes (100ml) at 0°C, then adding a 2M solution of trimethylaluminum in toluene (48 ml) over 10 min. This mixture is stirred for 12-18 h as it is warmed up to ambient temperature. This mixture is

refluxed for 24 h, allowed to stand for 2 days and is then poured onto chloroform/silica gel. Filtration is followed by washing with 50% methanol/chloroform and then evaporation of the filtrates gives a yellow oil.

- 5 Purification is performed using reverse phase HPLC to give the amidine. This compound is then subjected to the same general procedure as noted above for the preparation of hydrazines from anilines.

UTILITY

Compounds of the present invention are useful as inhibitors of proteases, which play a significant role in the progression of cancer. Their inhibitory activity includes inhibition of urokinase (uPA) which has been postulated to have therapeutic value in treating cancer.

The compounds of this invention are also useful as anticoagulants for the treatment or prevention of thromboembolic disorders in mammals. The term "thromboembolic disorders" as used herein includes arterial or venous cardiovascular or cerebrovascular thromboembolic disorders, including, for example unstable angina, first or recurrent ischemic attack, stroke, atherosclerosis, venous thrombosis, deep vein thrombosis, thrombophlebitis, arterial embolism, kidney embolisms, and pulmonary embolisms. The anticoagulant effect of compounds of the present invention is believed to be due to the inhibition of Factor Xa (FXa), Factor VIIa (FVIIa), and thrombin.

Some of the compounds of the present invention show selectivity between uPA and FXa, with respect to their inhibitory properties. The effectiveness of compounds of the present invention as inhibitors of Urokinase and Factor Xa is determined using synthetic substrates and purified Urokinase and purified human Factor Xa respectively.

The rates of hydrolysis by the chromogenic substrates were measured both in the absence and presence of compounds of the present invention. Hydrolysis of the substrates result in the release of the -pNA moiety, which is monitored spectrophotometrically by measuring the increase in absorbance at 405 nano meter (nm). A decrease in the rate of absorbance change at 405 nm in the presence of a

inhibitor is indicative of enzyme inhibition. The results of this assay are expressed as the inhibitory constant, K_i app.

Factor Xa determinations were made in 50 mM Tris buffer, pH 7.5, containing 1M NaCl, 5 mM CaCl₂, 0.05% Tween-20, and 1.5 mM EDTA. Values of K_i app. were determined by allowing 2-3 nM human Factor Xa (Haematologic Technologies, VT, USA) to react with the substrate (1 mM) in the presence of an inhibitor. Hydrolysis of the chromogenic substrate is followed spectrophotometrically at 405 nm for five minutes. The enzyme assay routinely yielded linear progression curves under these conditions. Initial velocity measurements calculated from the progress curves by a kinetic analysis program (Batch K_i ; Peter Kuzmic, BioKin, Ltd., Madison, WI) were used to determine K_i app.

Urokinase inhibition determinations were made in 50 mM Tris (pH7.5), 150 mM NaCl, 0.05% Tween-20, 0.002% antifoam, and 1 mM EDTA. human Urokinase (from American Diagnostica, CT, USA). Values of K_i app. were determined by allowing 20 nM human Urokinase to react with the Pefachrome substrate (0.3 mM, Centerchem, CT, USA) in the presence of an inhibitor. Hydrolysis of the chromogenic substrate is followed spectrophotometrically at 405 nm for five minutes. The enzyme assay routinely yielded linear progression curves under these conditions. Initial velocity measurements calculated from the progress curves by a kinetic analysis program (Batch K_i ; Peter Kuzmic, BioKin, Ltd., Madison, WI) were used to determine K_i app.

Table IV lists inhibition constants (K_i app.) for representative compounds of the present invention. These values are for uPA and FXa.

Definitions

The compounds of the present invention may have asymmetric centers. Compounds of the present invention containing an asymmetrically substituted atom may be isolated in optically active or racemic forms. It is well known in the art how to prepare optically active forms, such as by resolution of materials. Many geometric isomers of olefins, C=N double bonds, and the like can be present in the compounds described herein, and all such stable isomers are contemplated in the present invention. Cis and trans geometric isomers of the compounds of the present invention are described and may be isolated as a mixture of isomers or as separated isomeric forms. All chiral, diastereomeric, racemic forms and all geometric isomeric forms of a structure (representing a compound of Formula I) are intended, unless the specific stereochemistry or isomeric form is specifically indicated.

As used herein, the following terms and abbreviations have the following meaning, unless indicated otherwise.

The term "prodrug" is intended to represent covalently bonded carriers which are capable of releasing the active ingredient of Formula I, when the prodrug is administered to a mammalian subject. Release of the active ingredient occurs *in vivo*. Prodrugs can be prepared by techniques known to one skilled in the art. These techniques generally modify appropriate functional groups in a given compound. These modified functional groups however regenerate original functional groups by routine manipulation or *in vivo*. Prodrugs of compounds of Formula I include compounds wherein a hydroxy, amidino, guanidino, amino, carboxylic or a similar group is modified.

"Pharmaceutically acceptable salts" is as understood by one skilled in the art. Thus a pharmaceutically acceptable salt includes acid or base salts of compounds of Formula I. Illustrative examples of pharmaceutically acceptable salts are mineral acid (hydrochloric acid, hydrobromic acid, phosphoric acid, and the like) salts, organic acid (acetic acid, propionic acid, glutamic acid, citric acid and the like) salts, quaternary ammonium (methyl iodide, ethyl iodide, and the like) salts. It is understood that the pharmaceutically acceptable salts are non-toxic. Additional information on suitable pharmaceutically acceptable salts can be found in *Remington's Pharmaceutical Sciences*, 17th ed., Mack Publishing Company, Easton, PA, 1985, which is incorporated herein by reference.

"Optional" or "optionally" means that the subsequently described event or circumstance may or may not occur, and that the description includes instances where the event or circumstance occurs and instances in which it does not. For example, the phrase "optionally is substituted with one to three substituents" means that the group referred to may or may not be substituted in order to fall within the scope of the invention. Thus the term "optionally substituted" is intended to mean that any one or more hydrogens on a designated atom can be replaced with a selection from the

indicated group, provided that the designated atom's normal valence is not exceeded, and that the substitution results in a stable compound. When the substituent is keto (=O) then 2 hydrogens on the atom are replaced. "Optional substituents" , unless otherwise indicated, are independently selected from a group consisting of H; N(R¹⁰)₂; NO₂; halogen; aryl; O-C₅₋₁₀ cyclo alkyl substituted with R¹⁰; guanidino; urea; thio urea; amidino; para or meta phenoxy; piperidin-4-yloxy; 4-amino-cyclohexyloxy; 1-(1-Imino-ethyl)-piperidin-4-yloxy; 1-(1-Imino-ethyl)-pyrrolidin-3-yloxy; 2-Amino-3-methyl-butyryl; 4-Acetimidoylamino-cyclohexyloxy; 1-(1-Imino-ethyl)-pyrrolidin-2-ylmethoxy; 2-(2-Hydroxycarbonimidoyl-pyridin-3-yloxy)-ethoxy; 3,4-Dicyano-phenoxy; SC₁₋₄ alkyl, S-aryl, O-C₁₋₄ alkyl, COOR¹⁰, C(O)-pyrrolidine; C(O)CH(NH₂)CH₂OH; C(O)CH(NH₂)CH₂Ph; C(O)CH(NH₂)CH₂COOH; O-pyrrolidine; C(O)-(CH₂)₁₋₃-imidazole; SO₂-N(alkyl)₂; C(=N)-C₃; O-piperidine; 2-aminothiazol-5-ylmethoxy; O-CH₂-COOH; pyrrolidine-2-ylmethoxy; 2,4,6-triamino pyrimidin-5-ylmethoxy; NH-SO₂-alkyl; NHC₁-C₄ alkyl; N(C₁-C₄)₂ alkyl; CF₃; C₂₋₁₀ alkenyl and C₁₋₁₀ alkyl.

"Alkenyl" is intended to include a branched or straight chain hydrocarbon group having one or more unsaturated carbon-carbon bonds which may occur in any stable point along the chain, such as ethenyl, propenyl, and the like. The term "alkelene" represents an alkyl group, as defined above, except that it has at least one center of unsaturation, i.e., a double bond. Illustrative examples are butene, propene, and pentene. The term "cycloalkyl", "cycloalkyl ring", "cycloalkyl radical" or "cyclic hydrocarbon" indicates a saturated or partially

d]imidazole-2-yl. It is preferred that when the total number of hetero atoms in the heterocycle exceeds 1, then the heteroatoms are not adjacent to one another. Preferred bicyclic heterocyclic ring structures comprise 9 to 10
5 membered bicyclic heterocyclic ring structures comprising a six membered ring and a five membered ring fused together such that the two rings have two common atoms. Illustrative examples of the preferred bicyclic heterocyclic ring structures are 1H-indole-2-yl, 1H-
10 benzimidazole-2-yl.

The term "heteroaryl" is intended to represent a stable 5 to 10 membered aryl group ("aryl" as defined above), wherein one or more of the carbon atoms is replaced by a hetero atom selected from N, O, and S. The
15 hetero atoms can exist in their chemically allowed oxidation states. Thus a Sulfur (S) atom can exist as a sulfide, sulfoxide, or sulfone. Preferred heteroaryl groups are six membered ring systems comprising not more than 2 hetero atoms. Illustrative examples of preferred
20 heteroaryl groups are thienyl, N-substituted succinimide, 3-(alkyl amino)-5,5-dialkyl-2-cyclohexen-1-one, methyl pyridyl, alkyl theophylline, furyl, pyrrolyl, indolyl, pyrimidinyl, isoxazolyl, purinyl, imidazolyl, pyridyl, pyrazolyl, quinolyl, and pyrazinyl. The term

The following structural representations further
 illustrate the term "het":

wherein G_1 and G_2 independently at each occurrence represent $S(O)_{0-2}$, NH, $N-R^{24}$, O, CR^{10} , or CHR^{10} ; J_1 , J_2 , J_3 , and J_4
 15 independently represent CR^{10} or N, wherein at least two of J_1 , J_2 , J_3 , and J_4 represent CH; K_1 , K_2 , K_3 and K_4
 independently represent $-NHR^{10}$, $-NHR^{24}$, $-CHR^{10}$, $-CH-C(=NH)-NH_2$, or $N-C(=NH)-NH_2$ wherein at least two of K_1 , K_2 , K_3 and K_4
 represent CH_2 ; M_1 , M_2 , M_3 and M_4 independently represent
 20 NHR^{10} , $-NHR^{24}$, $-CHR^{10}$, $-CH-C(=NH)-NH_2$, or $N-C(=NH)-NH_2$, wherein
 at least two of M_1 , M_2 , M_3 and M_4 represent CH or CH_2 ; and R^{25}

 25 The variables R^{10} and R^{24} are as defined earlier. The dashed
 lines indicate optional unsaturation without violating the
 valency rules.

The term "basic group" as used under R^7 and R^8 , defined
 earlier, is intended to represent amidino, guanidino, $-C(=NH)N(R^{10})_2$,
 2-imidazoline, $-N$ -amidinomorpholine, N -

amidino piperidine, 4-hydroxy-N-amidino piperidine, N-amidino pyrrolidine, tetrahydro pyrimidine, and thiazolidin-3-yl-methylideneamine. The compounds of the present invention were named using the "Autonom", a Beilstein Commander 2.1 Application, distributed by Beilstein.

The term "natural amino acid", as used herein is intended to represent the twenty naturally occurring amino acids in their 'L' form, which are some times also referred as 'common amino acids', a list of which can be found in *Biochemistry*, Harper & Row Publishers, Inc. (1983). The term "unnatural amino acid", as used herein, is intended to represent the 'D' form of the twenty naturally occurring amino acids described above. It is further understood that the term unnatural amino acid includes homologues of the natural amino acids, and synthetically modified form of the natural amino acids. The synthetically modified forms include amino acids having alkylene chains shortened or lengthened by up to two carbon atoms, amino acids comprising optionally substituted aryl groups, and amino acids comprised halogenated groups, preferably halogenated alkyl and aryl groups.

The term "natural amino acid side chain" is intended to represent a natural amino acid ("natural amino acid" as defined above) wherein a keto (C=O) group replaces the carboxylic acid group in the amino acid. Thus, for example, an alanine side chain is $C(=O)-CH(NH_2)-CH_3$; a valine side chain is $C(=O)-CH(NH_2)-CH(CH_3)_2$; and a cysteine side chain is $C(=O)-CH(NH_2)-CH_2-SH$. The term "unnatural amino acid side chain" is intended to represent an unnatural amino acid ("unnatural amino acid" as defined above) wherein a keto (C=O) group replaces the carboxylic acid group forming unnatural amino acid side chains similar to ones illustrated under the definition of "natural amino acid side chain" above.

It thus follows that a "N-natural amino acid side chain" substituent and "N-unnatural amino acid side chain"

substituent, which can represent Q, Q¹, Q², Q³, L¹, L², L³ and L⁴, is a group wherein the nitrogen atom (N) is the annular ring atom substituted with a natural or unnatural amino acid side chain (natural or unnatural amino acid side chain is a defined above). The point of attachment between the nitrogen atom and the natural or unnatural amino acid side chain is at the keto (C=O) group of the respective amino acids. Thus a N-natural amino acid, i.e., N-cysteine, is N-C(=O)-CH(NH₂)-CH₂-SH.
